

HESI SuperVit - a highly concentrated plant stimulator

HESI SuperVit is a highly concentrated plant stimulator comprised of 15 plant-active vitamins and 10 amino acids.

Vitamins for the plants:

Vitamins and amino acids are both building blocks and biocatalysts in general metabolism. They structure the DNA (the genetic material) and plant hormones (cytokinins and gibberellins) which control the growth of leaves and flowering of plants. The vitamins and amino acids also play an active role in photosynthesis and the supply of energy.

Plants and vitamins:

All plants need vitamins to live, just like we humans. Unlike people, plants can produce all the necessary substances themselves, starting with inorganic fertilisers, water and carbon dioxide. If additional quantities of these substances are made available to the plants, the plants use them direct and save energy, which is then available for other purposes.

What does HESI SuperVit do:

SuperVit is a highly concentrated solution of plant-active vital elements, which are produced naturally by fungi. SuperVit replaces the function of the fungi and makes the plant less dependent of climatic conditions.

The plants can optimally process the light offered (more photosynthesis). This starts the growth of a strong and healthy plant, and strong flowering shoots form.

Dosage:

At every watering or spraying, 2 drops in 10 litres of water or 1 ml / 50-65 litre water

Package sizes: 10 ml / 50 ml / 100 ml / 500 ml
